

Triangular active walker: corrected theory matches KMC (equilateral display)

(a) Corrected exact theory ($\gamma = 0.01$, $\varepsilon = 0.15$, $t = 50$)

(b) Kinetic Monte Carlo ($N = 100,000,000$)

(c) Horizontal cross-section through the walker

Minimum-image triangular display. MC noise floor $\approx 4.22e-06$; corrected theory is at the noise floor. The old c_3 sign gives the red curve.
