

Triangular active walker: corrected theory matches KMC; residuals are noise-like (equilateral display)

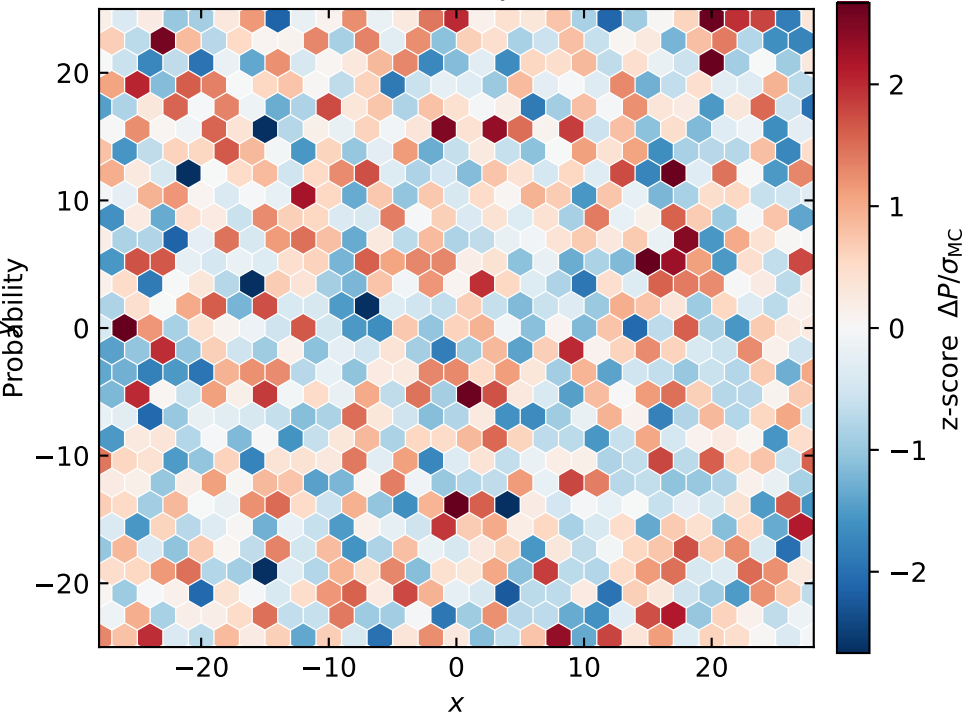

(a) Corrected exact theory ($\gamma = 0.01$, $\varepsilon = 0.15$, $t = 50$)

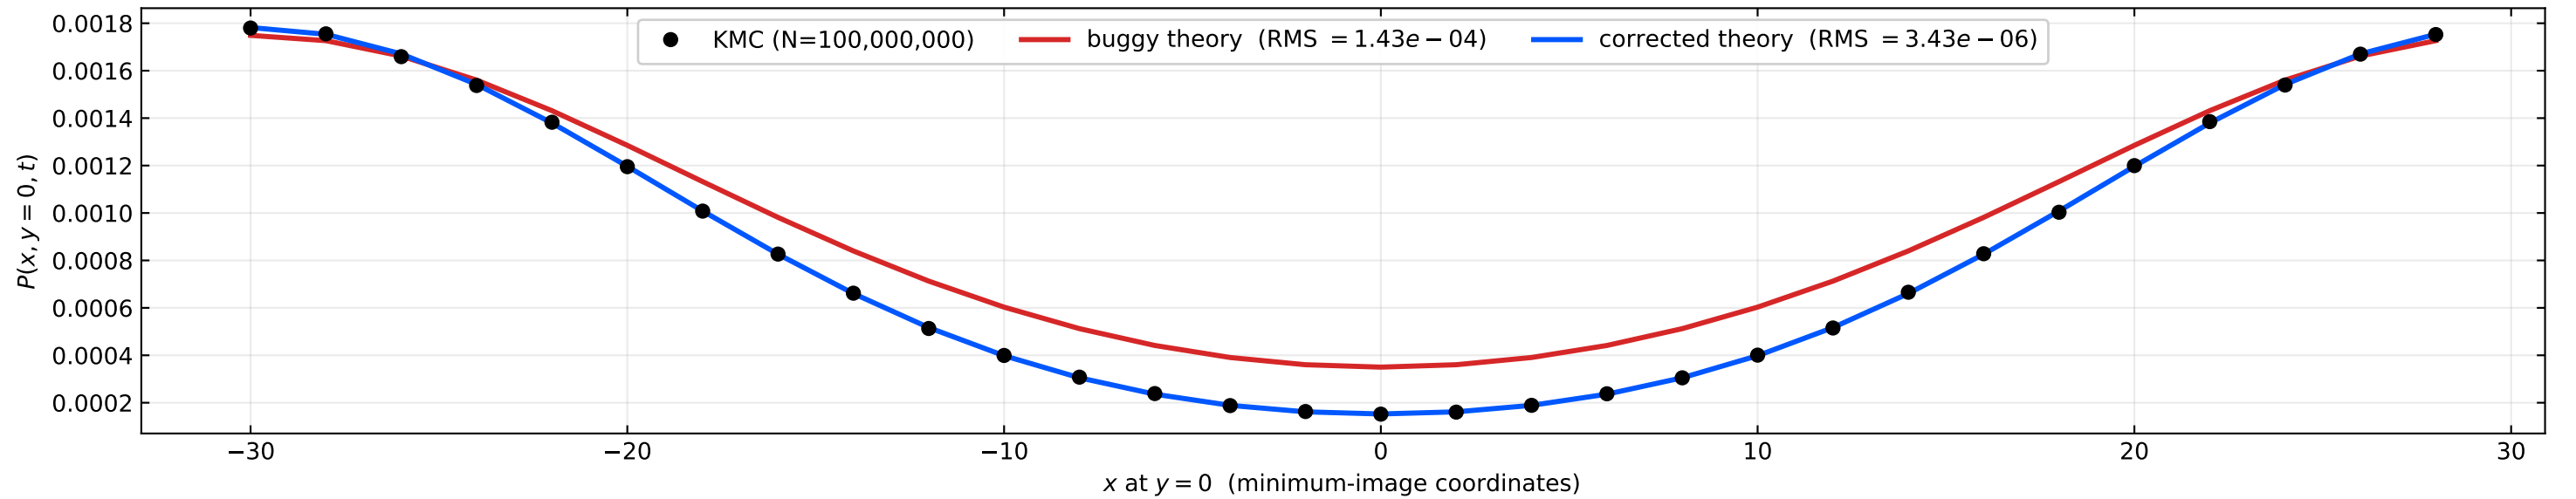

(b) Kinetic Monte Carlo ($N = 100,000,000$)

(c) Residual $(P_{\text{theory}} - P_{\text{KMC}})/\sigma_{\text{MC}}$

(d) Horizontal cross-section through the walker

MC noise floor $\approx 4.22e-06$; corrected theory is at the noise floor. The old c_3 sign gives the red curve.
